## LUBRICATION

The running parts of the engine proper and transmission are lubricated with oil pressure-fed from a trochoid pump driven from the clutch through gears. The large-capacity oil pump, located on the inner side of the clutch, lifts oil from the sump through a metal-screen strainer and forces it through an oil filter and a pressure switch toward engine and transmission.

In the transmission, the oil is guided into the oilways provided in countershaft and drive shaft, and is sprayed out through oil holes to lubricate the gears and bearings.

In the engine, the oil flows first into a gallery drilled out in the crankcase wall, from which it is distributed to crankshaft and, through upward oilways, to cylinder head for valve mechanism lubrication.

All the paths of this pressure-fed oil are in the form of drilled holes and cast-out pockets.
